

Favicons are the icons of your web-site that are displayed on various mobile devices. For example, if someone wants to add your site to their home screen, they will view the icon you include. There are quite a few formats you need to handle, including iPhone, iPad, Android devices and Microsoft devices. To help you with this process, you can use a touch icons generator web-site, for example [realfavicongenerator.net \(http://realfavicongenerator.net\)](http://realfavicongenerator.net).

These icons are placed in /favicons directory. Make sure you also edit the manifest.json and change the "Name" to your company's title.
